Dining Ballot - Choose your favorite!

Problem Statement -

UB has a number of dining centers and eateries enjoyed by not only students but faculty and other employees as well. It is quite a task for people to decide on where to eat and also for UB management to decide on which places to keep. Each dining centre has either buffets or multiple sub-diners to choose from, each offering a variety of food items. Not only at UB, but this is a dilemma observed at many places, in general. Given the number of options a person has, we aim on creating an online voting system where people can vote for their favorite dining place based on a number of parameters. We plan on using Blockchain technology which will ensure vote validation, elimination of bias, proper candidacy and will make the system fraud tolerant as a whole. It also provides an efficient voting system in a decentralized environment. This will help narrow down on a lot of choices.
